Answers: 1. (a) When we compare the results of experiments 2 and 3, we see that when [B] doubles, the rate doubles, so the reaction is first order with respect to B. Experiments 2 and 3 prove that the rate must double when [B] doubles. Knowing this, we can see that when the rate doubles

Chemical Kinetics: The Rates and Mechanisms of Chemical Reactions 3 \* Rate is not constant, it changes with time. Graphing the data of an experiment will show an average rate of reaction. You can find the instantaneous rate by computing the slope of a straight line tangent to the curve at that time.
