A triangle can have a maximum of 1 obtuse angle. Any triangle must have interior angles that add up to 180°. An obtuse angle is an angle greater than 90° but less than 180°. If you had an angle that was 91°. The other 2 angles would have to be acute. This is because the other angles would take up 180°-91°=89° of the triangle. Since 89° is less than 90°, this means the other 2 angles ...

"How many angels can dance on the head of a pin?" (alternatively "How many angels can stand on the point of a pin?") is a reductio ad absurdum challenge to medieval scholasticism in general, and its angelology in particular, as represented by figures such as Duns Scotus and Thomas Aquinas. It is first recorded in the 17th century, in the context of Protestant apologetics.

10 interior angles; 10 vertices; Decagon Angles. In many decagons, the sum of interior angles will be 1,440 °, but that is not an identifying property because complex decagons will not have that sum. Regular decagons have two additional identifying properties: 10 exterior angles of 36 °, summing to 360 ° 10 interior angles of 144 °, summing ...

The Polygon angle theorem states that the sum of all interior angles is equal 180(n-2), where n is the number of sides, which is also equal to the number of interior angles. Therefore, knowing the measure of of one interior angle (150 per problem definition), the sum of all interior angles could be written as 150n.
