Universal Gravitation Formula Gravity is the attractive force that exists between any two objects in the universe. Such an attractive force between two objects depends on the masses of the objects involved as well as on the distance between the objects. Newton's Law of Universal Gravitation is very important in this regard.

The constant G is called the universal gravitational constant and Cavendish determined it to be  $G = 6.67 \times 10^{-11} \text{N} \cdot \text{m}^2/\text{kg}^2$ . The word 'universal' indicates that scientists think that this constant applies to masses of any composition and that it is the same throughout the Universe.
